Privacy and security

Udyam Digital / Airtel SYNC submission / 9 November 2026

Purpose and permission

Owners provide business needs, team size and budget to build a plan. Registration lookups and document extraction require affirmative consent for the demo order. Pausing consent blocks further verification. Withdrawal deletes the current workspace, its orders and help requests immediately.

Only the information the step needs

Registration identifiers enter the synthetic lookup transiently. Persistent records contain a masked display value and hash, business name/address, registry status, extracted signatory name, document dates and check results. The app clears identifier entry after lookup and disables request logging. It does not retain original identity-document numbers.

Local document processing

PNG/JPEG uploads, limited to 8 MB, use Apple Vision or Tesseract locally. Temporary uploads are removed after extraction. Images never go to cloud OCR. The supplied fictional fixtures use 15 July 2026 for freshness checks. OCR uncertainty, mismatches and expired evidence need correction or partner review. Extraction does not establish authenticity.

Retention and owner controls

A random HttpOnly, SameSite=Strict cookie scopes each workspace. Records expire after 24 hours without activity. Cleanup runs at startup and on workspace requests. Withdrawal cascades deletion. SQLite is local and unencrypted. Record deletion does not guarantee forensic erasure or remove operating-system backups. A production service needs defined backup expiry and verified erasure.

Gemini and separate permission

Gemini assistance requires its own opt-in, separate from KYC consent. Only the current needs message and allowlisted sizing, goals, budget and current-tool categories go to Google. Common identifiers and contact patterns are redacted from chat, but this cannot guarantee anonymisation. Owners are told to omit personal details. Documents, registry records and stored names/addresses are excluded. Google processes requests under the configured account terms; no zero-retention claim is made. Disabling Gemini stops further AI requests. The local pricing engine checks every proposal.

Security boundary and production work

This prototype binds to loopback. Mutations require same-origin JSON. Orders stay within their session, and operator transitions require consent and an audit note. The partner role and provider activation are local simulations. Production requires authenticated roles, encrypted storage, managed secrets, rate limits and malware scanning, signed provider events, consent records, rights and grievance procedures, incident response and legal review.
